

Exercise sessions: 27.-28.1.2022 Hand-in due: Tue 1.2.2022 at 23:59

Topic: Metric spaces, continuous functions

Written solutions to the exercises marked with symbol  are to be returned in MyCourses. Each exercise is graded on a scale 0–3. The deadline for returning solutions to problem set 3 is Tue 1.2.2022 at 23:59.

Exercise 1 (Parallelogram law and norms not induced by inner products).

- (a) Prove that the norm in an inner product space V satisfies the *parallelogram law*

$$\|u + v\|^2 + \|u - v\|^2 = 2\|u\|^2 + 2\|v\|^2 \quad \text{for all } u, v \in V.$$

- (b) Using part (a), prove that the norm of Example IV.25

$$\|(x, y)\|_\infty = \max\{|x|, |y|\}, \quad \text{for } (x, y) \in \mathbb{R}^2,$$

is not induced by any inner product on \mathbb{R}^2 .

Hint: If the formula of part (a) does not hold for some pair of vectors $u, v \in \mathbb{R}^2$, then...

Exercise 2 (An exotic metric on the real line).

- (a) Prove that the formula

$$d(x, y) = \log(1 + |x - y|)$$

defines a metric on \mathbb{R} .

- (b) Let $A = [0, 1]$ and $B = (5, 10]$. Determine the diameter $\text{diam}(A)$ of the set A , and the distance $\text{dist}(A, B)$ between the two sets, both with respect to the metric d of part (a).

 **Exercise 3** (A comparison of the Euclidean norm and the ℓ^1 -norm).

This exercise concerns the comparison of the norm $\|x\| = \|x\|_2 = \sqrt{\langle x, x \rangle}$ on the space \mathbb{R}^d induced by the inner product $\langle x, y \rangle = \sum_{i=1}^d x_i y_i$, and the norm $\|x\|_1 = \sum_{i=1}^d |x_i|$ of Exercise 4 of Problem set 2.

- (a) Prove that for all $x \in \mathbb{R}^d$ we have

$$\|x\| \leq \|x\|_1 \leq \sqrt{d} \|x\|.$$

Hint: (From Väisälä's book) The first inequality: Write $x = \sum x_j e_j$. The second inequality: Apply the Cauchy-Schwarz inequality to the vectors $(|x_1|, \dots, |x_d|)$ and $(1, 1, \dots, 1)$.

- (b) Give a concrete example of a vector $x \neq \bar{0}$, for which the latter inequality in part (a) becomes an equality. Such an example demonstrates that the coefficient \sqrt{d} in the inequality is optimal (as small as possible).

 **Exercise 4** (A product space metric and continuity via component functions).
Let (X, d_X) , (Y, d_Y) , (Z, d_Z) be three metric spaces.

- (a) Consider the Cartesian product $X \times Y$, and define

$$d_1: (X \times Y) \times (X \times Y) \rightarrow [0, +\infty)$$

by the formula

$$d_1((x_1, y_1), (x_2, y_2)) = d_X(x_1, x_2) + d_Y(y_1, y_2)$$

for all $x_1, x_2 \in X$, $y_1, y_2 \in Y$. Check that d_1 thus defined gives a metric on the product space $X \times Y$.

- (b) Let $f: Z \rightarrow X$ and $g: Z \rightarrow Y$ be two functions. Consider the function

$$h: Z \rightarrow X \times Y \quad \text{given by} \quad h(z) = (f(z), g(z)) \quad \text{for } z \in Z.$$

Prove that when the Cartesian product space $X \times Y$ is equipped with the metric d_1 of part (a) and when the functions f and g are continuous, then the function h is also continuous.

 **Exercise 5** (Some Lipschitz and non-Lipschitz functions).

Let (X, d_X) and (Y, d_Y) be two metric spaces and let $K \geq 0$. Recall that a function $f: X \rightarrow Y$ is K -Lipschitz, if

$$d_Y(f(a), f(b)) \leq K d_X(a, b) \quad \text{for all } a, b \in X.$$

Here, on the real line \mathbb{R} and its subsets, we use the standard metric.

- (a) Prove (with mean value theorem or algebraically), that the function

$$p: [-10, 10] \rightarrow \mathbb{R}, \quad p(x) = x^3 \quad \text{for } x \in [-10, 10],$$

is K -Lipschitz for a suitably chosen $K \geq 0$.

- (b) Prove that the function $q: [0, 1] \rightarrow [0, 1]$, $q(x) = \sqrt{x}$, is not K -Lipschitz for any $K \geq 0$ (although it is continuous).
