Aalto University Problem set 4

Department of Mathematics and Systems Analysis

MS-C1541 — Metric spaces, 2023-2024/III

K Kytölä & D Adame-Carrillo

Exercise sessions: 1.-2.2.2024 Hand-in due: Tue 6.2.2024 at 23:59

Topic: Continuous functions, homeomorphisms, sequences in metric spaces

Written solutions to the exercises marked with symbol  $\triangle$  are to be returned in My-Courses. Each exercise is graded on a scale 0-3. The deadline for returning solutions to problem set 4 is Tue 6.2.2024 at 23:59.

Exercise 1 (Verifying openness and closedness of subsets).

(a) Show that the set  $U = \{(x, y, z) \in \mathbb{R}^3 \mid x^2 < y^2 + z^2 - xyz + 3\} \subset \mathbb{R}^3$  is open and that the set  $F = \{(x,y) \in \mathbb{R}^2 \mid x^2 + y^2 \le 2 \text{ and } x \le \frac{1}{3}\sin(\pi y)\} \subset$  $\mathbb{R}^2$  is closed.

Hint: Express the sets U and F appropriately using preimages; for the latter it is best to use two different functions and an intersection of preimages.

The continuity of the functions involved can be considered known.

(b) Consider the space  $\mathcal{C}([-1,1])$  of all continuous functions  $f:[-1,1]\to\mathbb{R}$ , equipped with the metric induced by the sup-norm  $\|\cdot\|_{\infty}$ . Consider the

$$D = \left\{ p \in \mathcal{C}([-1,1]) \mid p(x) \ge 0 \ \forall x \in [-1,1], \ \int_{-1}^{1} p(x) \, \mathrm{d}x = 1 \right\}.$$

Show that  $D \subset \mathcal{C}([-1,1])$  is a closed set.

<u>Hint</u>: You may use the facts that evaluation functions  $f \mapsto f(x)$  (for an arbitrary  $x \in [-1,1]$ ), and the integration function  $f \mapsto \int_{-1}^{1} f(x) dx$  are continuous functions  $\mathcal{C}([-1,1]) \to \mathbb{R}$  with the chosen metric. Otherwise the ideas are similar to part (a).

Exercise 2 (The closure of a set).

Let (X, d) be a metric space and  $A \subset X$  a subset. The closure of A is by definition the set

$$\overline{A} = X \setminus \text{ext}(A), \quad \text{where}$$
  

$$\text{ext}(A) = \left\{ x \in X \mid \exists r > 0 : \ \mathcal{B}_r(x) \subset X \setminus A \right\}.$$

- (a) Prove that the set  $\overline{A}$  is closed.
- (b) Prove that for  $x \in X$ , the following two conditions are equivalent:
  - (i)  $x \in A$ ;
  - (ii) there exists a sequence  $(a_n)_{n\in\mathbb{N}}$  such that  $a_n\in A$  for all  $n\in\mathbb{N}$  and  $\lim_{n\to\infty} a_n = x.$

<sup>&</sup>lt;sup>1</sup>This subset D could be interpreted as the set of all continuous probability density functions supported on the interval [-1, +1].

## **Exercise 3.**

(a) Let X be a set,  $J \neq \emptyset$  a nonempty index set, and  $A_j \subset X$  subsets for each  $j \in J$ . Prove De Morgan's laws for arbitrary unions and intersections:

$$X \setminus \bigcup_{j \in J} A_j = \bigcap_{j \in J} (X \setminus A_j)$$
 and  $X \setminus \bigcap_{j \in J} A_j = \bigcup_{j \in J} (X \setminus A_j)$ .

- (b) Using part (a) and known properties of open sets, prove the following (stated as Theorem VII.16 in the lecture notes):
  - Arbitrary intersections of closed sets are closed.
  - Finite unions of closed sets are closed.

## Livercise 4 (Some homeomorphisms).

(a) Let  $a, b \in \mathbb{R}$  with a < b. Prove that the open interval  $(a, b) \subset \mathbb{R}$  and the real line  $\mathbb{R}$  are homeomorphic,  $(a, b) \approx \mathbb{R}$ .

*Remark:* The continuity of the functions involved can be considered known (you can for example use judiciously chosen rational functions).

(b) Consider the cylinder surface  $C \subset \mathbb{R}^3$  and the annulus  $A \subset \mathbb{R}^2$  given by

$$C = \left\{ (x, y, z) \in \mathbb{R}^3 \mid x^2 + y^2 = 1 \right\}$$
$$A = \left\{ (\xi, \eta) \in \mathbb{R}^2 \mid 1 < \xi^2 + \eta^2 < 2 \right\}$$

(we named the coordinates in  $\mathbb{R}^3$  and  $\mathbb{R}^2$  differently here to avoid confusion). Prove that the cylinder C and the annulus A are homeomorphic,  $C \approx A$ .

<u>Hint</u>: To construct a homomorphism between C and A, you can use a homeomorphism  $(1,2) \approx \mathbb{R}$  from part (a) to make the radial direction of the annulus correspond to the z-coordinate of the cylider, while doing something simpler with the angular parts.

 $\triangle$  Exercise 5 (Coordinatewise convergence is not sufficient for convergence in  $\ell^1$ ). Consider the space

$$\ell^1 = \left\{ x = (x_j)_{j \in \mathbb{N}} \in \mathbb{R}^{\mathbb{N}} \mid \sum_{j=1}^{\infty} |x_j| < \infty \right\}$$

of absolutely summable real sequences. We consider it known that the formula  $||x||_1 = \sum_{j=1}^{\infty} |x_j|$  for  $x = (x_j)_{j \in \mathbb{N}} \in \ell^1$  defines a norm on  $\ell^1$ . We equip  $\ell^1$  with the metric induced by the norm  $||\cdot||_1$ .

(a) Show that if a sequence  $(x^{(n)})_{n\in\mathbb{N}}$  of elements  $x^{(n)} = (x_j^{(n)})_{j\in\mathbb{N}} \in \ell^1$  converges in  $\ell^1$  to  $x = (x_j)_{j\in\mathbb{N}}$ , then for every  $k \in \mathbb{N}$ , the sequence  $(x_k^{(n)})_{n\in\mathbb{N}}$  of the k:th coordinates of  $x^{(n)}$ 's converges to  $\lim_{n\to\infty} x_k^{(n)} = x_k$  (limit in  $\mathbb{R}$ ).

<u>Hint</u>: You can start by showing that the k:th coordinate projection function  $(x_j)_{j\in\mathbb{N}} \mapsto x_k$  is a 1-Lipschitz function  $\ell^1 \to \mathbb{R}$ .

(b) For  $n \in \mathbb{N}$  let  $x^{(n)} = (x_j^{(n)})_{j \in \mathbb{N}} \in \ell^1$  be the element given by

$$x_j^{(n)} = \begin{cases} 1 & \text{if } j = n \\ 0 & \text{if } j \neq n. \end{cases}$$

Show that for any  $k \in \mathbb{N}$  we have  $\lim_{n\to\infty} x_k^{(n)} = 0$  but in the space  $(\ell^1, \|\cdot\|_1)$  the sequence  $(x^{(n)})_{n\in\mathbb{N}}$  does not converge.

<u>Hint</u>: If the sequence would converge in  $\ell^1$ , then part (a) together with the first calculation of (b) identifies the only possibility for a limit  $x \in \ell^1$ . Now show directly from the definition of limits that we do not have convergence to that candidate limit.
